

Password protection of excel documents

Customer: International banking company

Industry: Bank

Country: Panama

Technology utilized: the following technologies were used on this solution,

- UiPath RPA
- Excel

Customer needs: Protect excel documents with a password generated by the Information Security department, so the content of the document can be viewed but not edited.

Development: At VR4 we design and develop the automation of a process where the robot receives the documents that needs protection, protect

them with a password but allows the operator to have access to change the format of the forms. Finally, depending on which day it runs, the system creates a folder tree in the server with what is needed for each particular day.

Benefit: Thanks to this process automation, the client was able to automatically provide a level of security which does not depend on a human being. It dramatically increases the system independence, preventing security failures due to delays, forgetfulness or omissions by the staff.

Automation + innovation
= **Transformation**

Let's start together
